## ABSTRACT

The NWT Resident Hunter Harvest Survey has been taking place annually in essentially its present form since 1982/83. At the end of each licence year all Resident Hunters are mailed a questionnaire requesting information on the past year's hunting activity and successes.

In 1993/94, 2173 hunters were sent the survey package. The survey was delivered to 1748 of them and responses to the survey totalled 1086.

The Resident Hunter Survey in 1993/94 covered barren-ground and woodland caribou, moose, Dall's sheep, black bear, wolf, wolverine, hares, grouse, ducks and geese. The popularity of hunted game ranked in descending order, based on available licencing information, is small game, barren-ground caribou, moose, woodland caribou, wolf, black bear, wolverine then Dall's sheep.

Results from the survey are summarized and presented in a variety of table formats that address interest in hunting, response to the survey, hunting effort, hunt success, composition of the harvest, wildlife management area use and projections of estimated total harvests.

# INTRODUCTION

NWT Resident Hunters are primarily non-natives who meet the 2-year residency requirement and are 16 or more years of age for big game hunting or, if certain conditions are met, can be between 14 and 16 years of age for small game. Resident Hunters make up approximately 20% of the 1993/94 NWT hunting public. Approximately half of the population of NWT Resident Hunters lives in Yellowknife.

The NWT Resident Hunter Survey in much its present form has been ongoing since hunting licence year 1982/83. Minor changes have occurred over the years to the list of included species and questionnaire layout. The underlying method of 3 sequential mailings at the end of the licence year (July 1 to June 30) and the expansion of survey results to estimated total harvest has remained unchanged throughout the years.

This survey attempts to obtain hunting and harvesting information from all NWT Resident Hunters who purchased big game or small game hunting licences in the previous licence year. The list of hunters to survey is taken from the centralized Game Licensing system. Any inaccuracies in the licencing system database of course will be carried into the survey, the results and the projections to estimated total harvest.

Survey results are typically organized by community and region for each species. Community is where the hunter resides or resided at the time of licence purchase. Dall's sheep hunting showing up for a Baffin community can mean that a community resident travelled to take advantage of an opportunity to hunt or has relocated.

The wildlife covered by the survey in 1993/94 included barren-ground and woodland caribou, moose, Dall's sheep, black bear, wolf, wolverine, hares, grouse, ducks and geese. Resident Hunters can each purchase up to 5 barren-ground caribou tags and

any number of wolf and wolverine tags. The tag limit for woodland caribou, moose, black bear and Dall's sheep is 1 per hunter per year.

Some species are hunted incidentally or in combination with other primarily sought species. The popularity of game in descending order, based on available licencing information, is small game, barren-ground caribou, moose, woodland caribou, wolf, black bear, wolverine then Dall's sheep. Licencing information for waterfowl is not available for 1993/94 Resident Hunters.

Results from the survey are summarized and presented in a variety of table formats that address interest in hunting, response to the survey, hunting effort, hunt success, composition of the harvest, wildlife management area use and projections of estimated total harvests.

## METHODS

Hunting Licence information was maintained in a centralized database in the Game Licencing System. Annual licence and tag information from Renewable Resources offices and private vendors in the various regions was entered, batch mode, into the database tables by Department staff in regional centres. Resident Hunter name, address, licence and tag information was subsequently downloaded at the end of the licence year to form the list of hunters to be surveyed. As soon as practicable at the end of the licence year, the survey package was mailed out to all Resident Hunters recorded in the list from the Game Licencing System. The survey package included a letter introducing the survey and inviting the recipients' participation, a questionnaire on hunting activity and success, a small map of the wildlife management areas, a table of previous years results by region and a prepaid business reply mail envelope. The method of re-mailing the same basic package with slightly strengthening tone of the accompanying letter for 2 follow-ups of the non-respondents at intervals of approximately 6 weeks has remained the same as reported by Chalmers (1990). The questionnaire employed (Figures 1 & 2) and the included map (Figure 3) are reproduced below.

Compiled results from survey responses are projected to estimated total harvests by the "ratio method" using this algorithm:

*estimated harvest = reported harvest x total tags issued ÷ tags held by respondents*

This equation is used per species and can integrate groups of hunters from community to whole territory levels. At this time estimates cannot be derived for waterfowl as the NWT licencing system is not dedicated to issuing migratory bird hunting permits.

# *HUNTER HARVEST QUESTIONNAIRE 1993/94*

DO NOT REMOVE LABEL.
QUESTIONNAIRE IS CONFIDENTIAL WHEN COMPLETED.

NOTE:

1. THIS QUESTIONNAIRE IS FOR THE PERIOD JULY 1, 1993 TO JUNE 30, 1994.
2. PLEASE complete each section whether your hunting trip was successful or not.
3. This information is confidential and will not be used for enforcement purposes.
4. A 'Wildlife Zone' map is enclosed.

**IF YOU PURCHASED A SMALL GAME TAG ONLY PLEASE PROCEED TO SECTION H**

**A** **DID YOU HUNT BARREN - GROUND CARIBOU?** Yes ☐ No ☐

If yes, were you successful? Yes ☐ No ☐

Please provide the following data - whether your hunt was successful or not.

| Hunt Location Lat/Long or nearest landmark | Wildlife Zone | Month of Hunt | # Days Hunted | Number of each type of kill: Bulls | Cows | Juveniles |

COMMENTS: _____

Figure 2. Second page of questionnaire.

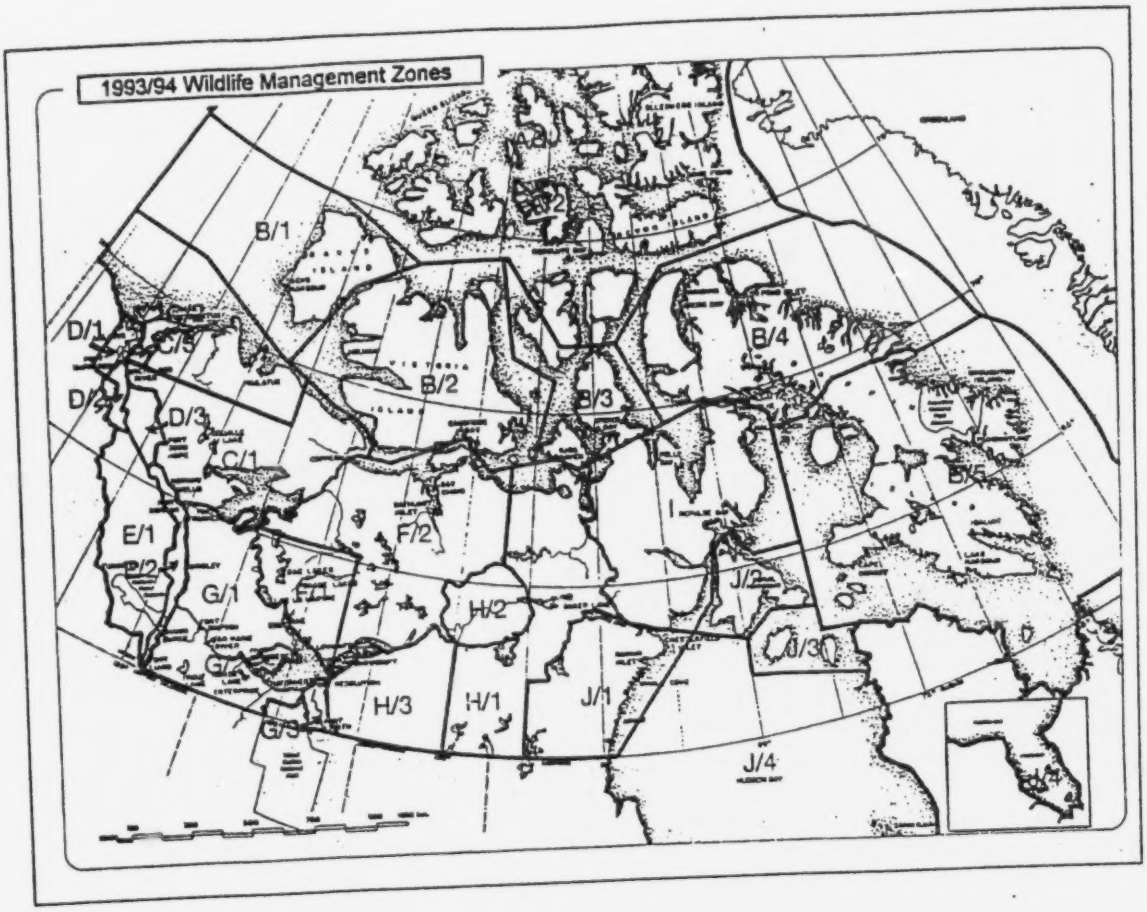

**Figure 3. NWT Wildlife Management Zones in 1993/94.**

In the case of the widely hunted barren-ground caribou, the so-called "linear regression method" can also be used to project reported kill to estimated total harvest. In this method reported kills accumulated over the response waves (for mailings 1 to 3) are regressed against accumulated tags reporting and the estimated kill is determined by extrapolating the best fit line to total issued tag number. The Norecon report (GNWT 1994) found that there is no significant difference in estimates derived by the ratio or the regression method at the regional level of integration. The regression method is not always practical at the lower levels of hunter integration where there are few hunters and

little caribou hunting. The method relies on adequate response over three waves to establish a best-fit line. The regression method has typically been used at the level of regional integration.

## RESULTS AND DISCUSSION

In 1993/94 there were 2173 NWT Resident Hunters recorded in the Game Licencing System. Of these, 1929 had big game licences and 1547 held authorizations for small game. The survey package was mailed to 100% of the hunters and was delivered to 1748 of them over the course of 3 mailing waves. Replies were received from 1068 of the hunters who received the survey package. Hunting activity was reported by 808 of those who responded to the survey. Detailed information, by community, on numbers of hunters and their licences is listed in **Appendix 1:** ***Number of NWT Resident Hunting Licence Holders***. **Appendix 2:** ***Survey Response by NWT Resident Hunters*** details the response down to community level.

Overall, there is considerable variation in the level of hunt detail provided and in the completeness of response received back from hunters in this survey. When preparing the results tables, attempts were made to include any and all information provided.

Results for hunter-group integrations at successively higher levels are calculated from the original response data and are not derived from lower level integrations reported in the same tables. This is necessary because of respondent inconsistencies in filling in the blanks on the survey questionnaire. For example, there may be a number of hunts reported but duration information may only be reported for a fraction of those. Average days hunted can only be calculated on the basis of the number of hunts that reported their duration and not on the total of all hunts made.

Some species are hunted incidentally or in combination with other primarily sought species. The popularity of game in descending order, based on available licencing information, is small game, barren-ground caribou, moose, woodland caribou, wolf, black

bear, wolverine then Dall's sheep. Information for waterfowl is not available for 1993/94.

**Appendix 3:** ***Hunter Response and Kills by Survey Wave*** presents hunt success by hunt number for each of the survey response waves and uses the ratio method to expand total reported kill to an estimated total kill down to the community level. Waterfowl are not included in this table. The species composition of small game harvest per community is presented in **Appendix 4:** ***Small Game Harvest by Community Respondents, Reported and Estimated Kill.*** A species breakdown of reported waterfowl harvest is detailed in **Appendix 5:** ***Waterfowl Harvest Reported by Community Respondents.***

The Norecon report (GNWT 1994) and to some extent the Chalmers (1990) report engage in a discussion of the validity of estimating harvest for a population of NWT Resident Hunters from a respondent sample. The basic assumptions in the method employed are that hunt information is reported accurately and that the behaviour and success of the respondents indeed reflects that of the entire population of interest. At this point we continue to live with the uncertainties inherent in these assumptions but can take some comfort in the fact that 61% of those who received the questionnaire responded to it. The year-to-year consistency of the method can provide, at a very minimum, a basis for valid trend assessment across spans of years (assuming of course that the licence and tag information at the start is correct).

Hunting effort expressed as average number of days spent hunting is presented per community in **Appendix 6:** ***Number of Hunts Made and Average Days Hunted by***

***Respondents***. No hunt duration information was collected for small game, wolf and wolverine hunts.

Information on management areas hunted is presented in a series of tables in the appendices listed below. These tables include the number of hunts and age/sex information for any reported caribou, moose, black bear and Dall's sheep kills. The hunts included in these tables are only those where a management area was listed on the completed questionnaire. Information on waterfowl and small game lists the number of reported hunts and total kills only. Management area information for wolf and wolverine hunts was not requested on the survey questionnaire in 1993/94.

The Wildlife Management Zone map in use at the time appears to have caused some confusion particularly in the southern portion of zone G-1. The G-1 area south of the Mackenzie River and Great Slave Lake was sometimes referred to by hunters as G-2 because of the positioning of the G-2 label for the Mackenzie Bison Sanctuary. The same scenario with labels arrowed to small zones may have caused some miss-assignment in some other areas too though likely to a much lesser extent than in the more heavily used G zone.

**Appendix 7:** ***Management Areas Hunted for Cervids by Community Respondents*** (cervids include barren-ground and woodland caribou and moose).

**Appendix 8:** ***Management Areas Hunted for Black Bear by Community Respondents.***

**Appendix 9:** ***Management Areas Hunted for Dall's Sheep by Community Respondents.***

**Appendix 10:** ***Management Areas Hunted for Other Game by Community Respondents*** (includes reported hunts and total reported kills for small game, waterfowl and occasionally wolf).

Appendices 11 to 14 cover a series of tables that present the same hunt and kill information as the previous 4 but organize it by management area with the communities that hunt there listed for each.

**Appendix 11:** ***Communities that Hunted Cervids in the Various Management Areas.***

**Appendix 12:** ***Communities that Hunted Black Bear in the Various Management Areas.***

**Appendix 13:** ***Communities that Hunted Dall's Sheep in the Various Management Areas.***

**Appendix 14:** ***Communities that Hunted Other Game in the Various Management Areas.***

## ACKNOWLEDGEMENTS

It is the NWT Resident Hunters who year after year take the time to complete the survey questionnaires who enable this study to continue. It is this relationship of responsible hunters with their wildlife management agencies that will allow the sustainable continuation of the hunting tradition.

Thanks must also be extended to those GNWT workers who administered our system of licencing and kept the central database updated with the information needed to run this survey.

Big thanks also to all the helpers at wildlife headquarters who lent a hand in getting all the survey paper organized and on its way to the intended victims.
